Eye Cream

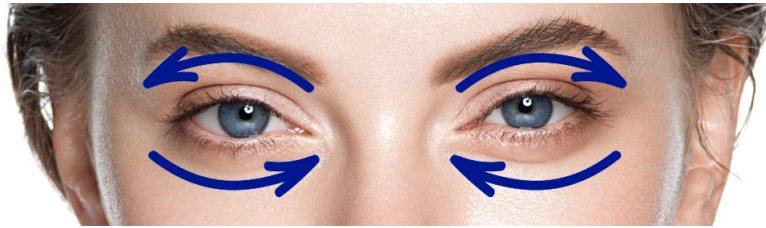

An intensive nourishing skin firming cream

How to use

Using a spatula, take a small amount of the cream from the jar and rub it between your thumb and ring finger to warm up and to enhance absorption.

Apply the cream onto the orbital bone.

The cream should be spread along a circle around your eye: starting from the inner corner and moving along the upper eyelid outwards to the outer corner, and then along the lower eyelid, moving from the outer corner of the eye inwards to the inner corner.

Using the ring finger, spread the cream with a tapping motion, paying particular attention to the corners of the eyes and to the wrinkle formation areas.

Application tips

The eye cream should be applied as the last step of the skincare routine, after cleansing and applying serum (optional).

In case you use serums or intensive gels to complement your skincare routine, make sure they are fully absorbed by the skin before applying the eye cream.

Do not touch your skin with the spatula. After each application, wipe the spatula off with a dry tissue.

Use the minimum amount of the cream. If there is any leftover residue on your skin 15 minutes after application, blot it with a dry tissue.

If you use the cream at night, apply it 1-1.5 hr before bed. This will allow the cream to work more effectively.
